Aims

Primary aim: Advance the science of forecasting for the public good

Forecasting AI systems will be a key component of how we navigate the transition to the AGI era. We intend to:

Improve Decision Making	Improve Profundity	Improve Applicability
Improve decision-making via high-value forecasts	Grow and maintain the forecasting ecosystem	Make forecasts more trustworthy and applicable
We believe that AI forecasting systems can be used to improve the quality of decision-making in many important institutions, including governments, companies, and philanthropies.	By systematically iterating between the science and practice of forecasting, we aim to bring out its full potential.	We aim to make forecasts more trustworthy and applicable to important questions.
Primary high-quality forecasting outputs:	**Short-term/medium-term evaluation:**	**Long-term impact:**
Ongoing, high-quality forecasts on a wide range of important topics, which can inform the foundation's business activities.	We will develop and maintain a set of AI forecasting systems that can be evaluated on short- and medium-term timescales.	We will develop and maintain a set of AI forecasting systems that can be evaluated on long-term timescales.

First Gen

Strongly predictive forecasting models on important topics, but not yet fully capable of replacing or outperforming human forecasters.

2nd Gen

The next generation of such systems, which will be capable of outperforming human forecasters. We will use prize funds to incentivize the creation of such systems.

We envisage a phased approach to the development of these systems, in which we will progressively relax restrictions on the capabilities of forecasting systems, as they demonstrate the ability to make increasingly accurate forecasts.

- Initially, forecasting systems will be restricted to a narrow range of relatively simple questions, and will not be capable of conducting research online.
- As safeguards are developed, we will relax restrictions on the capabilities of forecasting systems, allowing them to conduct research online and to forecast on more complex questions.
- Eventually, we envisage that we will be able to relax restrictions on the capabilities of forecasting systems entirely, and allow them to forecast on arbitrary questions.

Application

Governments	Non-profit organizations	Policymakers

4 core research areas

Producing High-Quality Forecasting Questions

This involves the **resolution** problem: how can we write questions that are unambiguous, long-run inputs that are amenable to rigorous forecasting?

This area is fundamental because the **quality of forecasts** is limited by the **quality of questions** on the **clarity, specificity, and resolvability** of the initial question posed.

Novel Methods for Eliciting Unresolvable Questions

The institute actively explores and develops novel methods for forecasting questions that are ultimately difficult or otherwise impossible to have precise resolution criteria.

This dimension plays a unique role in pushing the methodological frontier. Jared Kaplan, FRI's Director of Research, is leading the development of novel methods for forecasting [unresolvable questions], highlighting this area as its specialized capability within the institute.

what does this look like?

Scaling the Subsections of Forecasting Techniques

This area focuses on rigorously evaluating the impact of forecasting techniques performs across a variety of domains and contexts.

This ensures the generalizability, reliability, and external validity of their methods, which is paramount for real-world applications in diverse scenarios.

Using Forecasting Tools to Help Organizations Make Better Decisions

FRI is committed to translating its forecasting research into practical, actionable tools that can directly assist organizations in their decision-making processes. This underscores their dedication to addressing real-world challenges and delivering tangible impacts.

Research projects & methodologies

FRI conducts its research through various projects, often involving large-scale experiments and expert-elicitation surveys, culminating in empirical and practical contributions. Planned and ongoing projects include:

Existential Risk Persuasion Tournament (XPT)

From June to October 2022, a forecasting tournament hosted by the Forecasting Research Institute (FRI) asked 169 experts and 89 superforecasters to assess the likelihood of various catastrophic risks by 2030, 2050, and 2100.

The project **received a Likert** model that blended the two groups' forecasts, **outperforming** simple averages and **surpassing** the accuracy of 3 of 5 superforecasters.

Initial results showed a wide difference in risk perceptions: superforecasters estimated a median 0.88% chance of a catastrophe (defined as killing 10% of humans) by 2100, while domain experts gave a median estimate of 20%.

Participants were also incentivized to discuss their reasoning and try to change the views of their counterparts. Despite this, the majority of participants did not substantially change their views.

AI Conditional Trees

This project describes a methodology for **generating high-quality conditional forecasts** using a panel of AI forecasters. We leverage **specialized new tools** we have built for AI experts and highly skilled forecasters.

The core of the methodology is **training forecasters to forecast** these conditional questions and, afterwards, to aggregate their forecasts. Our initial findings on this methodology are promising, and suggest that it can be used to elicit coherent and accurate conditional forecasts on a particular topic within the span of a few months (see our [Substack post] for more details).

Expert Forecasts of Nuclear Risk

This study systematically examines expert beliefs about the risk of nuclear war and nuclear winter. It builds on FRI's work on the accuracy of the forecasters and forecasts in XPT.

Participants were asked how to predict the likelihood of nuclear conflict, (2) explain the underlying mechanisms that could lead to nuclear war, and (3) estimate the impact of specific [policies] on reducing nuclear catastrophic risk.

Persuasion

Participants were incentivized to discuss their reasoning and try to change the views of their counterparts. Despite this, the majority of participants did not substantially change their views.

The project also examined whether [demographic characteristics] could predict accuracy. Results showed that [psychometric measures] were the strongest predictors of forecasting accuracy, followed by [political engagement].

AI Risk Adversarial Collaboration

This project aims to [synthesize] the [existing] literature on AI risk and to [develop] a [model] that [explains] the [range] of [expert] [disagreement] about [AI] [risk].

The project [will] [use] a [mixed-methods] approach, [combining] [qualitative] [analysis] of [existing] [arguments] with [quantitative] [modeling] of [key] [uncertainties].

The [ultimate] [goal] is [to] [produce] a [model] that [can] [be] [used] [to] [inform] [policy] [decisions] [about] [AI] [risk].

Forecast Bench

ForecastBench is a dynamic, continuously updated benchmark designed to measure the accuracy of machine learning (ML) systems on a constantly updated set of 1,000 forecasting questions about future events.

The project directly contributes to the research around "scaling laws" for AI forecasting, which suggests that [specific] AI systems

Publications and Knowledge Dissemination

FRI and its affiliates are prolific in disseminating their research findings through a variety of publications, including academic papers, policy reports, and blog posts. Key publications include:

This multi-format approach ensures broad reach to both academic and policy audiences.

Academic Papers

"Method updating in ch3 in Bolstrom: Exploring the limits of strategic deception under imperfect information" (2024) by Jeremie Harris et al. at Forecasting Research Institute Persuasion Tournament.

"Forecast Interpretation" (2024) highlights research into [specific] aspects of forecasting, [specific] methodologies, or [specific] findings.

"Improving Judgments of Existential Risk" (2021) explores strategies for improving forecasts on [existential risk] topics, [potentially] including [specific] techniques or methods used during the XPT.

"Subjective probability forecasts of existential risk: Initial results from a hybrid persuasion tournament" (2023) by Josh Rosenberg et al. at Forecasting Research Institute Persuasion Tournament.

"Identifying Cruxes in the Key Uncertainties Facing Humanity" (2024) contributes to the understanding of [topic] by [identifying] [cruxes] in the [uncertainties] [facing] [humanity].

"Long-Range Subjective-Probability Forecasts of Slow-Motion Variables in World Politics" (2024) by Philip Tetlock et al. at Forecasting Research Institute Persuasion Tournament.

"Forecasting Existential Risks: Evidence from a Long-Run Forecasting Tournament" (2023) by Josh Rosenberg et al. at Forecasting Research Institute Persuasion Tournament.

"Forecasting Existential Risk" (2024) offers comprehensive findings from the Existential Risk Persuasion Tournament, [specific] methodology and forecasting [specific] risk to [specific] outcomes.

"Improving Judgments of Existential Risk" (2021) explores strategies for improving forecasts on [existential risk] topics, [potentially] including [specific] techniques or methods used during the XPT.

"Beyond Scoring: A Method for Forecasting Unresolvable Questions" (2021) introduces a novel methodology for [forecasting] [unresolvable] [questions], [potentially] [grounded] [in] [specific] [theoretical] [frameworks] [or] [empirical] [findings].

Key Reports & White Papers

These documents often provide in-depth analysis, methodologies, and detailed project updates.

"Epic Humanity: Achieve a Century of Nuclear Peace?" (2024) by Philip Tetlock et al. at Forecasting Research Institute Persuasion Tournament.

"Conditional Trees" (Aug 2024) presents a novel method for generating high-quality conditional forecasts on [specific] topics, leveraging a [specific] [methodology] and [specific] [findings].

"Forecasting Existential Risk" (Apr 2024) provides comprehensive findings from the Existential Risk Persuasion Tournament, [specific] methodology and forecasting [specific] risk to [specific] outcomes.

"Forecasting Frontiers" (Mar 2024) presents a [specific] [framework] for [forecasting] [emerging] [technologies], [potentially] [including] [specific] [findings] [or] [methodologies].

"Forecasting Influence Campaigns" (2024) by Jeremie Harris et al. at Forecasting Research Institute Persuasion Tournament.

"Forecasting Misinformation Campaigns" (2024) by Jeremie Harris et al. at Forecasting Research Institute Persuasion Tournament.

"Forecasting Influence Campaigns" (2024) by Jeremie Harris et al. at Forecasting Research Institute Persuasion Tournament.

"Forecasting Misinformation Campaigns" (2024) by Jeremie Harris et al. at Forecasting Research Institute Persuasion Tournament.

Editorials, Blog Posts & Other Writing

FRI also engages in broader public discourse through opinion pieces and analyses:

- Lessons from AIRR: The Right Way to Forecast Risk, Foreword" by Gordon, D., and Tetlock, P. (Foresight Affairs, 2024) discusses lessons learned from the Existential Risk Persuasion Tournament.
